

CODING CONTEST – 1

QUESTION – 3:

The screenshot shows the 'General configuration' page in the AWS S3 console. The bucket name is 'awsbucket'. The AWS Region is 'EU (Stockholm) eu-north-1'. There is a section for 'Copy settings from existing bucket - optional' with a 'Choose bucket' button. The console header shows the AWS logo, 'Services' menu, a search bar, and the user 'SUGANTHI G'.

The screenshot shows the 'Object Ownership' page in the AWS S3 console. It explains that object ownership determines who can specify access to objects. There are two main options: 'ACLs disabled (recommended)' and 'ACLs enabled'. The 'ACLs enabled' option is selected. Below this, there is a warning message: 'We recommend disabling ACLs, unless you need to control access for each object individually or to have the object writer own the data they upload. Using a bucket policy instead of ACLs to share data with users outside of your account simplifies permissions management and auditing.' At the bottom, under 'Object Ownership', the 'Bucket owner preferred' option is selected, with a note: 'If new objects written to this bucket specify the bucket-owner-full-control canned ACL, they are owned by the bucket owner. Otherwise, they are owned by the object writer.' The 'Object writer' option is also visible but not selected. The console header is the same as the previous screenshot.
